Aflatoxin Effect On Health

Dr Subroto Mukherjee
USAID/East Africa
What is ‘Toxin’

- A toxin (from Ancient Greek: toxikon) is a poisonous substance produced within living cells or organisms.

- It simply means, it is a biologically produced poison.
Aflatoxins are naturally occurring toxins that are produced by species of a fungus called *Aspergillus*.

**Types**
*Aspergillus flavus* and *Aspergillus parasiticus*
The Fungus - Aspergillus

• Survive temperatures ranging from 12°C to 48°C

• Survives on many organic nutrient sources like plant debris, tree leaves, decaying wood, animal fodder, cotton, compost piles, dead insects and animal carcasses, stored grains, and even immunocompromised humans and animals.

• At latitudes between 40°N and 40°S of the equator

• Contaminate 25% of crops worldwide
The toxins are produced as secondary metabolites by the fungi in temperatures range between 24 and 35°C, within many commodities whenever the moisture content exceeds 7% (10% with ventilation)
Aflatoxin Prone African Dietary Staples

- Maize
- Rice
- Corn
- Cassava
- Nuts
- Peanuts
- Chilies
- Spices
One form of the toxin is also released in milk.
- Primarily through contaminated food

- Some evidence exists through respiration
Who Gets Exposed

Everybody & Anybody
Both humans and live-stocks living in region where the fungus grows uncontrolled

But most are those in the lower socio-economic section and much of the live-stock in the unorganised sectors
How Does The Toxin Act?

- Apoptosis (programed cell death)
- Decrease protein synthesis
- Effects membrane stability leading to cell damage
- Inhibits nucleic acid (DNA – RNA) synthesis
How Does The Toxin Act?

- Apoptosis → Cell death
- Inhibits of nucleic acid (DNA – RNA)
  - synthesis → Mutation → Cancer
- Decrease protein synthesis → Stunting
- Effects membrane stability → cell damage
## Aflatoxin Effect on Human Health

The Principal Target Organ For Aflatoxins Is The Liver.
Aflatoxicosis

Aflatoxicosis is the poisoning that results from ingesting aflatoxins
Aflatoxicosis

Is Exposure related

1) large doses lead to acute illness and death, usually through liver cirrhosis;

2) Chronic low doses have nutritional and immunologic consequences; and

3) All doses have a cumulative effect on the risk of cancer
Acute Aflatoxicosis

Chronic Aflatoxin Exposure
Acute Aflatoxicosis

- Acute poisoning is characterized by an acute hepatotoxic disease that manifests itself with:
  - Depression
  - Anorexia
  - Jaundice
  - Hemorrhages
  - Edema of the lower extremities
  - Abdominal pain and vomiting

 Adult humans usually have a high tolerance of aflatoxin, and, in the reported acute poisonings, it is usually the children who die.
Chronic Exposure

- 4.5 billion people worldwide are at risk
  - Liver cancer: causative role in 5 – 28% of liver cancer cases
  - Impaired immune function
  - Childhood stunting
  - Possible neural tube defects

Both acute and chronic aflatoxin exposures are preventable
Aflatoxin and Cancer

Aflatoxin (B₁) is regarded as a class I carcinogen by the World Health Organization.
As per one estimate, 40% of the hepatocellular carcinoma (liver cancer) in Africa can be attributed to aflatoxin.
Hepatitis B virus (HBV) infection contributes to liver damage that is potentiated by chronic AF exposure leading to cancer

- The presence of the virus may interfere with AF metabolism and detoxification process
- Predisposition of HBV-infected hepatocytes to aflatoxin induced DNA damage;
- Viral replication and chronic inflammation in liver cell, may contribute to the mutation potentiated by AF
Aflatoxin and HIV

- HIV increases the toxic effect of Aflatoxin (AF) by decreasing the levels of anti-oxidant nutrients that helps detoxify AF in the body.

- For HIV virus to penetrate a cell it has to overcome the barrier of cell membrane & secretory IgA. AF reduces the level of secretory IgA thereby easing one of the barriers.

- In a large number of HIV cases there is a co-infection of HBV causing liver damages thereby potentiating the effects of AF.
Several studies have indicated the effect of Aflatoxin on growth leading to stunting.

The patho-biochemical mode of action of Aflatoxin indicates it can have direct effect on growth.
Under-nutrition Can Potentiate All These Effects Of Aflatoxin
Animal Health and Aflatoxin

- Animals have similar (and potentiated) pathological effect as found in Humans.

- In general, animals have greater pathological effect at lower concentrations.

- In animals, the affects of aflatoxin on the liver is greater at a much lower concentration than that for humans.
## Impacts of Aflatoxin on Livestock and Livestock Products

### Direct Impacts on Animals:
- Acute Toxicity
- Reduced growth rates and weight
- Immunosuppression at low doses

### Product Contamination:
- Meat
- Dairy, eggs, and cheese
- Farm fish
- Organ meats
The diagnosis of aflatoxicosis is often difficult because of:

- Variation in clinical signs,
- Gross pathological conditions
- Presence of infectious diseases due to the suppression of the immune system.
- No consistent diagnostic changes in hematocrit, hemoglobin, and differential cell counts.
Treatment

• The source should be eliminated immediately.
• Levels of protein and vitamins A, D, E, K and B should be increased.
• Secondary infections must receive immediate attention and treatment.
• Good management practices to alleviate stress
• Address specific system diseases
Treatment

• The source should be eliminated immediately.
• Levels of protein and vitamins A, D, E, K and B should be increased.
• Secondary infections must receive immediate attention and treatment.
• Good management practices to alleviate stress
• Address specific system diseases
PREVENTION

- Remove the sources
- Promotes better agricultural and storage techniques
- Have good resources for testing and early diagnosis
- Strict food quality standards
- General awareness and personal protection.
- Better livestock feeding & management
## Permissible Limits
### United States Food and Drug Administration

<table>

| 20                | • Food for human consumption  
• Feed corn, grains, and cottonseed meal for immature animals |
| 100               | • Feed corn and grains for breeding beef cattle, breeding swine, or mature poultry |
| 200               | • Feed corn and grains intended for finishing swine of 100 pounds or greater |
| 300               | • Feed corns and grains and for finishing (feedlot) beef cattle |
Aflatoxin Abatement Measures

Protection is Required throughout the value chain from “field to fork”

1. Pre-harvest
   - Bio Control
   - Improved Plant Varieties
   - Integrated Pest Management

2. Post-harvest
   - Post-Harvest Handling
   - Improved Storage
   - Quality Assurance of the Food Chain
